

# Controllers of Mosquitoes

When most people think of wetlands they often first think about the mosquitoes. Mosquitoes are certainly a common part of wetlands as they rely on water to reproduce. But wetlands are also home to many different kinds of animals that feed on the mosquitoes.

Dragonflies are believed to be the most important controllers of mosquitoes. Many other flying creatures also eat mosquitoes like the Big Brown Bat, the Antillean Night Hawk and the Flycatchers.

The waters are also filled with mosquito predators. These include the Guppy fish as well as tadpoles.
